

Simple Payroll Slip Generator - Project Documentation

INTRODUCTION

- This project demonstrates a C-based payroll slip generator.
- It automates employee salary computation and slip generation.
- The project highlights use of loops, functions, structures, and file handling in C.

OBJECTIVE

- To design a C program for generating payroll slips automatically.
- To calculate gross and net salary based on employee input.
- To utilize file handling for record storage and retrieval.

PROBLEM STATEMENT

- Manual payroll preparation can lead to errors and inefficiency.
- This system aims to automate payroll slip generation for accuracy and convenience.

SYSTEM REQUIREMENTS

- Hardware Requirements: Processor – Intel i3 or higher, RAM – 4GB minimum, Storage – 500MB free space.
- Software Requirements: OS – Windows/Linux, Compiler – GCC / Turbo C / Code Blocks / Dev C++.

SYSTEM DESIGN

- System Flow: Input → Process → Output → File Save.
- The system includes modules for data entry, computation, and storage.

MODULE DESCRIPTION

- Input Module – Accepts employee details such as name, ID, and basic pay.

- Processing Module – Calculates HRA, DA, and deductions.
- Output Module – Displays payroll slip with gross and net salary.
- File Handling Module – Saves employee salary details in a text file.

ALGORITHM

- 1. Start
- 2. Input employee details
- 3. Compute allowances and deductions
- 4. Calculate gross and net salary
- 5. Display slip and save record
- 6. Stop

IMPLEMENTATION

- Uses structures for employee records.
- Functions are used for salary computation and file operations.
- Example structure: `struct Employee { char name[50]; int id; float basic, hra, da, ded, gross, net; };`

RESULTS & DISCUSSION

- Summary of outputs generated by the program.
- Comparison with expected results.
- Observations on accuracy and performance.
- Challenges faced and how they were resolved.

CONCLUSION & FUTURE ENHANCEMENT

- The project successfully automates payroll slip generation using the C programming language.
- It improves efficiency and demonstrates file handling techniques.
- Future enhancements include GUI interface, database integration, and multi-user support.
